IS OFTEN PREFERABLE TO OTHER FORMS OF AMPHETAMINE—  
because—  
smaller doses produce longer cerebral stimulation, with a minimum of undesirable excitement and other side-effects.

When patients with depression, narcolepsy, alcoholism, or obesity are selected as suitable cases for stimulant therapy, 'Amphedroxyn Hydrochloride' is a prudent choice of drug.

# The workplace as an intervention setting

- The workplace is an ideal intervention setting
  - Access to large numbers of drug users
    - Most drug users are employed
  - Employees spend a lot of time at work
    - Maximises exposure
  - Employers support safety/productivity improvement & worker wellbeing initiatives
  - Existing IR & WH&S frameworks exist to support prevention & intervention strategies
  - Workplace prevention/intervention efforts extend to the wider community

- **Workplace interventions can overcome many common barriers to treatment**
  - Drug use not perceived as a problem
  - Lack of motivation
  - Work commitments
  - Lack of support
  - Lack of awareness of treatment options

# High risk workforce groups

- Workers aged 20-29
- Males
- Trades/blue collar
- Industry
  - Wholesale
  - Construction
  - Mining
  - Manufacturing
  - Hospitality

# Workplace risk factors

- **Workplace environment**
  - Availability
    - Workforce demographic, location, supervision level, policy response
  - Working conditions
    - Shift work, long hours, fast paced work, FIFO/DIDO work
- **Workplace motivations**
  - Reduce fatigue
    - Increased productivity, increased alertness
  - Reduce risk of positive drug test

# Implications for prevention/treatment

- Access to large numbers of 'at risk' individuals
  - Young males
  - Recreational/occasional users
- Opportunity for prevention & early intervention
  - Onsite awareness & brief intervention
  - Referral to counselling
- Provides treatment pathway
  - Employment as motivator

# Prevention/intervention strategies

- **Supervisor/manager training**
  - Signs & symptoms of use
  - Referral/supporting affected employees
  - Factors that contribute to use
- **Employee awareness**
  - Physical & mental health risks of use
  - Factors that contribute to use
- **Treatment pathways**
  - EAP/Community AOD (and other) services

# Summary

- the workplace provides an opportunity for cost effective prevention/early intervention strategies that can reach large numbers of drug users
- these strategies are likely to receive substantial employer support
- AOD agencies/service providers can play a significant role

NCETA Workplace Drug and Alcohol Use Information and Data Series

## Workplace Drug and Alcohol Testing

Ken Pidd, Ann Roche & Michael White

Drug and alcohol testing is increasingly popular as a way to manage perceived risk of workplace drug and alcohol use. Despite its popularity, workplace drug and alcohol testing is not without controversy. There is debate regarding its effectiveness. There is limited evidence that drug testing can identify current intoxication (except for alcohol), modify worker behaviour, reduce the incidence workplace injury and death or that it is a cost effective method for managing risk. However, as part of an integrated suite of responses to occupational health safety and worker wellbeing, testing may have a role in educating workers about the effects of drug and alcohol use and facilitating behaviour change.

This information sheet provides a brief overview of some of the main issues surrounding workplace testing, it examines the evidence for and against testing, and describes best practice in workplace testing programs.<sup>1</sup>

**Can workplace testing detect drug or alcohol related risk to workplace safety?**

In general, testing can detect past drug and alcohol use. However, the extent to which past drug use is a risk to workplace safety is debatable. Most drug or alcohol related risk to safety is likely to be due to intoxication and/or impairment.

Apart from breath analysis, which can detect alcohol intoxication, no other workplace drug test can detect current intoxication or impairment.

**Are there possible negative effects of drug testing?**

Drug testing may mask the true extent of risk to workplace safety if employees try to avoid detection rather than change their behaviour. Employees may also be reluctant to report near misses and minor accidents or injuries for fear of a positive test.

**Does workplace testing improve workplace safety?**

Evidence is inconclusive regarding the efficacy of drug testing in reducing workplace accidents and injuries. While some studies suggest that testing can reduce injury and accident rates, more rigorous studies indicate testing has only a small effect or no effect at all. Claims that workplace testing can substantially reduce workplace injuries, accidents and compensation claims are not supported by the available research evidence.
